

(c) counting rule: every action item in the SWE-agent trajectory = one command the agent issued and the sandbox executed, including failed/errored calls and the final submit; model turns without an action are not counted; no sub-agents exist in this harness.
 (d) AVG = mean of the per-task medians (no median of medians). AVG rows are unweighted means over the tasks, not time-weighted. Data: live census episodes (10 Hz cgroup accounting + trajectories).
