

SPEC vs Agentic, one vote per workload — combined agent fence (tool + harness)

SPEC = 26 benchmarks (dark blue), Agentic = the revised all-resolved 36 (dark red); points = the actual workloads · violin outline thin black; whisker = 5th-95th pct, thick black bar = IQR, white square = median, black circle = mean · med = group median (in the x labels)

hed configuration · axis breaks (//) only where max > 3 × pooled p95 · context-switches panel is LOG while the others are linear — do not compare shapes across panels · † SPEC's median is exactly 0: no position on a log axis, glyph clamped to the floor · KDE bandwidth: nrd0 × adjust=1.2 (per-side nrd0 in the numbers CSV)
